

## Final Report

The project involves the creation of a database to manage and track information related to children, parents, Staff, Attendance, activities, and classrooms. And how it shows the relationship between them in a children's psychology clinic. This database would enable the psychology clinic to efficiently track and manage data, including child profiles, parent information, staff details, class attendance, scheduled activities, and classroom assignments. These were designed to have a seamless flow in mind and were crucial for the clinic's daily operations and to deliver personalized care to children. The challenges I encountered while making this project were getting the information, organizing this information, making the table for the SQL workbench, and linking the relationships to the Project EER Diagram. The outcome of the database was successfully implemented, and the queries were able to return somewhat the expected results.
